Product overview

Flushing rings are used with flanged chemical seal systems for flushing or venting the space immediately in front of the diaphragm. They are simply mounted between the flanged process connection and the diaphragm seal. The two flushing ports allow washing out of particles accumulated in front of the membrane and the pressure space can be vented or drained according to requirement.

Applications

- Flush rings are used for diaphragm seals in order to prevent clogging of the instrument connection.
- The flush ring is mounted between the process flange and the diaphragm seal.

Standard Features

- The flushing ports allow the washing out of particles accumulated in front of the membrane.
- The pressure chamber can be vented or drained or filled with a cleaning liquid and subsequently flushed, depending on the requirement.
- Various nominal widths and forms allow adaption to the respective process flange. See Optional Features.
- Standard flushing connection: 1/2 NPT female
- Sealing face:
 - Acc. to EN 1092-1 Form B1
 - Acc. to ASME B 16.5 RF
- Materials: 316/316L, dual certified

Optional Features

- Pipe plugs and various valves
- Other sealing faces, e.g. groove, tongue, RTJ
- Exotic Alloys, e.g. Duplex, Alloy C-276, Alloy 625
- Flush rings for sour gas service are available in accordance with NACE MR0175/ MR0103 and ISO 15156 by default.
- Special cleaning
- Inspection certificate 3.1 acc. to EN 10 204
- Flush Ring Type G and Dual Flange Style Type D
 - Concentric or excentric (Type G only)
 - 1 or 2 vent / flushing connections
 - PFA lining optional (Type G only)
 - Adapting of nominal pipe size (NPS)
 - Allows disassembly of diaphragm seal without removing the flush ring
